# [Hands-on] 14. Kubernetes Volume

PVC를 통해서 PV를 동적으로 Provisioning하고 구성하는 실습입니다. 이 실습은 실행 환경에 따라 동적 생성이 안될 수도 있으니, 그 경우에는 실습 환경에 맞게 설정을 변경하여 진행하시기 바랍니다.

먼저 Wordpress 실행을 위한 파일들을 준비하겠습니다.

```
ubuntu@ip-10-0-1-161:~$ curl -LO https://k8s.io/examples/application/wordpress/mysql-deployment.yaml
          % Received % Xferd Average Speed Time
                                                        Time
                                                                Time Current
                                Dload Upload
                                                        Spent
                                  423
                                 1588
    1193 100
ubuntu@ip-10-0-1-161:~$ curl -LO https://k8s.io/examples/application/wordpress/wordpress-deployment.yaml
 % Total % Received % Xferd Average Speed
                                               Time
                                                        Time
                                                                Time Current
                                Dload Upload
                                                Total
                                                       Spent
                                  538
    1278 100
                                 1789
ubuntu@ip-10-0-1-161:~$ ls -al *-deployment.yaml
-rw-rw-r-- 1 ubuntu ubuntu 1193 Jul 7 16:46 mysql-deployment.yaml
-rw-rw-r-- 1 ubuntu ubuntu 1278 Jul 7 16:47 wordpress-deployment.yaml
```

명령에 : curl -LO https://k8s.io/examples/application/wordpress/mysql-deployment.yaml

명령어2: curl -LO https://k8s.io/examples/application/wordpress/wordpress-deployment.yaml

MySQL 실행에 필요한 Secret을 하나 만들겠습니다.

```
ubuntu@ip-10-0-1-161:~$ kubectl create secret generic mysql-pass --from-literal=password=pwd
secret/mysql-pass created
```

명령어1: kubectl create secret generic mysql-pass --from-literal=password=pwd

이제 MySQL을 실행할텐데요, 미리 받아둔 파일(mysql-deployment.yaml)을 이용합니다.

파일 내용은 아래와 같습니다.

```
apiVersion: v1
kind: Service
metadata:
name: wordpress-mysql
labels:
app: wordpress
spec:
ports:
- port: 3386
selector:
app: wordpress
tier: mysql
clusterIP: None
```

MySQL<sup>©</sup> Service

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
   name: mysql-pv-claim
   labels:
   app: wordpress
spec:
   accessModes:
   - ReadWriteOnce
resources:
   requests:
   storage: 20Gi
---
```

MySQL에서 사용할 PVC (동적 Provisioning)

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: wordpress-mysql
 labels:
    app: wordpress
spec:
  selector:
    matchLabels:
      app: wordpress
      tier: mysql
  strategy:
    type: Recreate
  template:
    metadata:
      labels:
       app: wordpress
       tier: mysql
    spec:
      containers:
      - image: mysql:5.6
       name: mysql
        env:
        - name: MYSQL_ROOT_PASSWORD
         valueFrom:
            secretKeyRef:
              name: mysql-pass
              key: password
        ports:
        - containerPort: 3306
         name: mysql
        volumeMounts:
       - name: mysql-persistent-storage
         mountPath: /var/lib/mysql
      volumes:
      - name: mysql-persistent-storage
        persistentVolumeClaim:
          claimName: mysql-pv-claim
```

MySQL Deployment

#### 설치를 진행합니다.

```
ubuntu@ip-10-0-1-161:~$ kubectl apply -f mysql-deployment.yaml
service/wordpress-mysql created
persistentvolumeclaim/mysql-pv-claim created
deployment.apps/wordpress-mysql created
```

명령어1: kubectl apply -f mysql-deployment.yaml

### 설치된 Object들은 다음과 같이 조회합니다.

```
ubuntu@ip-10-0-1-161:~$ kubectl get all
NAME
                                               STATUS
                                                          RESTARTS
                                                                     AGE
                                        READY
pod/wordpress-mysql-668d75584d-mjb6v
                                       1/1
                                                                     71s
                                                Running
NAME
                                      CLUSTER-IP
                                                    EXTERNAL-IP
                                                                  PORT(S)
                                                                             AGE
                          TYPE
                                      10.96.0.1
service/kubernetes
                          ClusterIP
                                                    <none>
                                                                  443/TCP
                                                                             3d5h
service/wordpress-mysql
                          ClusterIP
                                      None
                                                    <none>
                                                                  3306/TCP
                                                                             72s
NAME
                                                                    AGE
                                          UP-TO-DATE
                                                        AVAILABLE
                                  READY
deployment.apps/wordpress-mysql
                                  1/1
                                                                    72s
NAME
                                             DESIRED
                                                        CURRENT
                                                                  READY
                                                                          AGE
replicaset.apps/wordpress-mysql-668d75584d
                                                                          72s
```

<mark>명령어]:</mark> kubectl get all

그리고 이번에는 PVC와 PV를 조회해보겠습니다.

```
ubuntu@ip-10-0-1-161:~$ kubectl get pvc
NAME
                 STATUS
                          VOLUME
                                                                       CAPACITY
                                                                                  ACCESS MODES
                                                                                                 STORAGECLASS
                 Bound
                          pvc-a2771824-0d68-42d3-a2ac-072e8aef2265
                                                                      20Gi
mysql-pv-claim
                                                                                  RWO
                                                                                                                 5s
                                                                                                 standard
ubuntu@ip-10-0-1-161:~$ kubectl get pv
                                                                      RECLAIM POLICY
                                                                                                 CLAIM
                                            CAPACITY
                                                       ACCESS MODES
                                                                                        STATUS
                                                                                                                           STORAGECLASS
                                                                                                                                          REASON
                                                                                                                                                   AGE
pvc-a2771824-0d68-42d3-a2ac-072e8aef2265
                                                                                                 default/mysql-pv-claim
                                            20Gi
                                                       RWO
                                                                      Delete
                                                                                                                          standard
                                                                                                                                                   9s
                                                                                        Bound
```

명령어1: kubectl get pvc , kubectl get pv

PVC에 의해서 동적으로 PV가 생성된 걸 확인할 수 있습니다.

kubectl describe 명령으로 상세 내용도 확인해보세요.

```
ubuntu@ip-10-0-1-161:~$ kubectl describe pvc mysql-pv-claim
              mysql-pv-claim
              default
Namespace:

    ClaimName: mysql-pv-claim
    ReadOnly: false
  kube-api-access-25qk8:
    Type:
                             Projected (a volume that contains injected data from multiple sources)
    TokenExpirationSeconds: 3607
    ConfigMapName:
                             kube-root-ca.crt
    ConfigMapOptional:
                             <nil>
    DownwardAPI:
                             true
 .. 생략 ...
```

명령어1: kubectl get po , kubectl describe po [POD\_NAME]

Volumes부분과 Mounts 부분을 잘 확인해보세요.

이제 Wordpress도 실행합니다.

ubuntu@ip-10-0-1-161:~\$ kubectl apply -f wordpress-deployment.yaml service/wordpress created persistentvolumeclaim/wp-pv-claim created deployment.apps/wordpress created

명령어1: kubectl apply -f wordpress-deployment.yaml

그리고, MySQL과 마찬가지로 생성된

- PVC
- · PV
- · Pod

의 내용을 확인해보세요.

이번 실습은 여기까지 입니다. ˇㄴ`
